

# **Overhead Stirrers**

# Mechanical, Electronic, Software, Control and Design Engineering... Combining the best of all worlds

Designed to optimize complex stirring applications, IKA® offers the very best in overhead stirrer technology. Our overhead stirrers provide the perfect solution to all of your laboratory stirring and mixing needs, from lower to higher viscosities. IKA® overhead stirrers process stirring quantities up to 200 liters.

Our overhead stirrers stand out because of their indispensable features, which include: electronic safety circuit, push through agitator shaft, digital display, two speed ranges, and the ability to control the rheological changes and monitor all parameters using labworldsoft® software. Additionally, there are several other special features available, such as microprocessor controlled speed technology, removable wireless controller and a digital error display. A broad spectrum of stirring tools is the key to successful mixing! IKA® equipment meets CE standards and fulfils international safety regulations.

100 series

similar; both series feature a speed display and an overload protection. Furthermore, the control version is designed with a removable wireless controller and is equipped with a torque trend display, TFT display, RS 232 and USB interface. In addition, you will be able to update your firmware online by connecting your control device via USB to a computer.

### 1 R 2723 Telescopic stand

Particularly stable stand with an H-shaped base that prevents the stand from tipping backwards. Additionally, this stand is equipped with a spring stand rod, which enables heavy instruments / attachments to be raised and lowered smoothly without difficulty.

### EUROSTAR control | Advanced precision

Connector for fixing the wireless controller

IKA® further advances its' mixing technology by offering the first overhead stirrers with wireless technology. Stress-free mixing at your convenience with increased productivity, flexibility and enhanced safety features. Additionally, comes equipped with the new online update function (only control version), your device is always up-to-date.

The display shows torque, temperature, timer, speed and PC connectivity. Additionally, several other parameters can be set such as language, background, brightness, sound, etc.

The EUROSTAR control series can be operated via Bluetooth as well

### Knowledge | Torque & Viscosity

### Quality standards | Integrated Safety

#### Torque

Torque is mathematically defined as the vector product of force and lever arm. It is therefore calculated as M = F \* r, where M is the torque, r is the lever arm and F is the force. The magnitude of the force is based on the perpendicular distance from the axis of rotation to the line of action of the force.

The unit of measurement of torque is Nm. For example, in mixing systems, the drive power of an electric motor is delivered to the rotating drive shaft or the drill chuck fixed to the mixing tool. What matters is the transfer of power in the drive to the rotating mixing tool. Torque is the key to the relationship between the mixing tool geometry, viscosity of the medium to be mixed and the speed of rotation. The power is transferred from the motor to the shaft and then to the mixing tool. The torque acts on the mixing tool at the drill chuck as shown in the brochure.

#### Viscosity

The "viscosity" shown in our brochure always refers to the dynamic viscosity  $\eta$ . Viscosity is a measure of the fluid's resistance to flow or change in shape due to internal friction between the molecules. If a fluid has high viscosity, then it strongly resists flow. This is an important parameter to be considered when it is required to create product emulsions and suspensions by mixing and homogenizing or merely in the transfer of fluids from one location to another.

### $1N = [\eta] \cdot (m^2 \, m \, / \, m \, s) => [\eta] = Ns \, / \, m^2 = Pa*s$

Fluids are either Newtonian or Non-Newtonian. Fluids whose viscosity is constant at all shear rates are called Newtonian fluids (e.g., pure fluids, ideal fluids / water, oil and most gases which have a constant viscosity). Fluids whose viscosity is not constant at all shear rates are called Non-Newtonian fluids (e.g., blood, sand-water mixtures, dough, puddings, asphalt cement, etc.).

Oil is a good example of a highly viscous liquid. It does not flow easily and affects parameters such as the thickness of the lubricating film in bearings, motors, gear units, leakage losses in the hydraulics, pump efficiency and friction losses in pipes.

#### **Applications and Industries**

**Food**: Butter, mayonnaise, ketchup...

Cosmetics: Creams, shampoo, soap...

**Pharmaceutical industry**: Pills, tablets, suppositories... **Chemical industry**: Aluminum oxide, calcium

hydroxide, glycerin...

**Abrasives**: Silicon carbide, crystals, sand...

Inks and Coatings: Printing ink, coating paint...

Glues and Adhesives: Adhesive mixture, Vaseline,

two-component glue...

**Plastics and Polymers**: PVC powder, pre-polymer,

polyester resin...

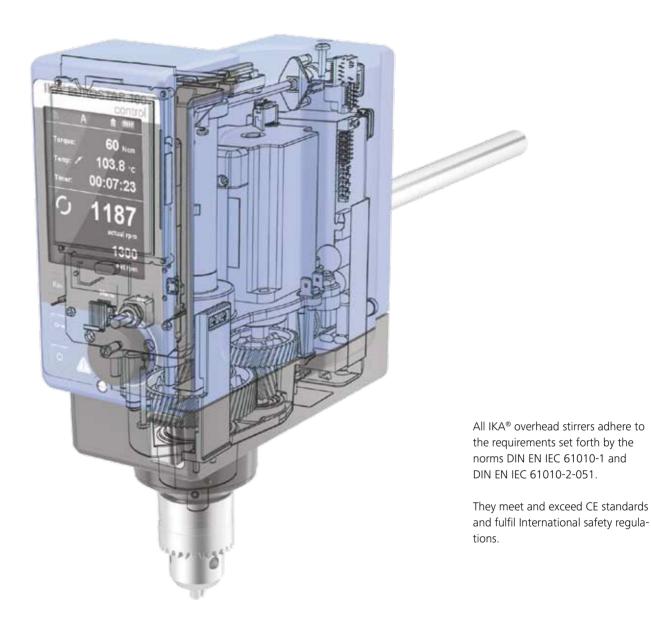

Paints and Pigments: Metallic paints, color pigment

suspension, dyes for adhesive plasters...

**Cement and Construction**: Concrete, mineral clay,

loam...

### IKA® offers more

### labworldsoft®

IKA® laboratory software labworldsoft® is an advanced software for all your laboratory needs. With the help of this software, you can network up to 64 laboratory devices via one PC. All test parameters can be documented ensuring complete automation of your laboratory experiments. Measurements and processes may be run independently. Long waits and processing times are reduced, which increases productivity.

### **Comprehensive Worldwide Service!**

Our dedicated team of engineers provides comprehensive worldwide technical service. Please feel free to contact your dealers or IKA $^{\circ}$  directly in case of any service queries. Hotline: In the event of an equipment malfunction or technical questions regarding devices and spare parts:

call 00 8000 4524357 (00 8000 IKAHELP)

### **IKA®** Application Support

Our Application Center spans 400 sqm and offers modern facilities for presenting and testing lab devices and processes. This brings us even closer to our customers and improves our service. Here, prospective buyers and customers can test out processes that involve stirring, shaking, dispersing, grinding, heating, analyzing and distilling. In addition, it also further extends the opportunity to test your own devices and to develop new models.

### Does IKA® supply an explosion-proof stirrer system?

IKA® does supply custom-made explosion-proof systems for larger volumes upon request.

# What does torque trend display mean in the case of the EUROSTAR control range – can they measure viscosity?

The EUROSTAR control units only display the change in torque. Normally, this is associated with a change in the viscosity of the medium. The viscosity cannot, however, be directly calculated from the data. In order to do so, one can use a viscometer.

### How long can a stirrer be operated without interruption?

All IKA® stirrers have a 100% duty cycle, i.e. they can be operated without interruption.

### Are there any stirrers which rotate in different directions?

All IKA® stirrers rotate in clockwise direction except for EUROSTAR 100 control which rotates in both clockwise and counter clockwise direction. Additionally, upon request for special applications, counter clockwise direction can be incorporated.

### What is the difference between the electronic and mechanical versions of the stirrers?

In mechanical stirrers, the speed is set by means of a continuously variable transmission. A higher torque can be made available directly in the lower speed range by altering the transmission ratio of the actuator. Whereas in electronic stirrers, the power output is monitored and controlled by a processor. This ensures a constant speed range even with changes in viscosity.

### What quantities and viscosities can be processed with IKA® stirrers?

Depending on the unit, maximum stirring quantity ranges from 20 ml to 200 liters. Similarly, the viscosity ranges from 1 mPas to 150,000 mPas.

### What should be the diameter of the vessel in relation to the stirrer tool?

In the case of water, the diameter of the vessel should be twice the diameter of the stirrer element and the height two or three times that of the stirrer element. In the case of high viscosity material, the stirrer element should be closer to the vessel wall.

### What ambient conditions are required for the operation of IKA® stirrers?

The ambient temperature should be consistent between 5 °C and 40 °C and the humidity should not exceed 80%.

### **Application Support!**

For questions regarding applications and processes, you can call our hotline number: **00 8000 4522777 (00 8000 IKAAPPS)\*** E-Mail: applicationsupport@ika.de
